Experimental Results of Microcontroller Based FC-TSR-TCR Systems

T. Vijayakumar and A. Nirmalkumar

Abstract—This paper deals with the simulation and experimental results of Fixed Capacitor Thyristor Switched Reactor Thyristor Controlled Reactor (FC-TSR-TCR) system. The FC-TSR-TCR system is simulated using MATLAB and the simulation results are presented. The power and control circuits are simulated. Laboratory model for the FC-TSR-TCR system is implemented using Atmel microcontroller and it is tested. The current drawn by the FC-TSR-TCR varies with the variation in the firing angle. Stepped variation of current is obtained using thyristor switched reactor. The experimental results are compared with the simulation results.

Index Terms—FACTS, FC-TSR-TCR, MATLAB, SIMULINK, Reactive POWER.

NOMENCLATURE

\[\begin{align*}
\alpha & \quad \text{Delay Angle} \\
i_L(t) & \quad \text{Current in the Reactor} \\
\sigma & \quad \text{Conduction Angle} \\
i_{LF}(\alpha) & \quad \text{Fundamental Reactor Current} \\
V & \quad \text{Amplitude of the applied AC Voltage} \\
L & \quad \text{Inductance of the Thyristor Controlled Reactor} \\
\omega & \quad \text{Angular Frequency of the Applied Voltage} \\
i_{LF \text{ max}} & \quad \text{Maximum Current} \\
X_c & \quad \text{Equivalent series reactance of the capacitor} \\
X_L & \quad \text{Equivalent series reactance of the Inductance} \\
V_c & \quad \text{Capacitor Voltage} \\
i_{FL} & \quad \text{fundamental reactor current} \\

I. INTRODUCTION

In the control of Electric Power Systems, systems and procedures are used to compensate dynamically the detrimental effects of non-linear loads. The compensation process should be carried out without important alteration of source signal quality. Some benefits are expected using compensation reduction of losses in distribution lines, harmonic content minoration, and power factor improvement. The dynamic behavior of industrial loads requires the use of compensator that can be adapted to load changes. Unfortunately, the techniques frequently used for compensation are based on circuit controllers that alter the waveform of the signal subjected to control. Such is the case of the static compensator [1-2], which must perform harmonic cancellation, reactive power compensation, power factor correction, and energy saving. Although the static compensator is commonly used and studied under sinusoidal voltage conditions, waveforms corresponding to the controlled current present high harmonic content.

This paper focuses on the fixed capacitor Thyristor Switched Reactor Thyristor controlled
reactor [3], as shown in Fig 1. Compensation with FC-TSR-TCR consists of controlling the current in the reactor \( L \) from a maximum (thyristor valve closed) to zero (thyristor valve open) by the method of firing delay angle control. The fixed capacitor (FC) and TCR constitute a basic VAR-generator arrangement (FC-TCR). The constant capacitive VAR generation of \( C \) is opposed by the variable VAR absorption of the TCR. The Simulink circuit model of FC-TSR-TCR system is shown in Fig 2.

Calculation of the firing angle can be made in the time domain [4] or in the frequency domain [5]-[6], using different approaches. Assuming the supply voltage to be sinusoidal, calculation of the firing angle is obtained with minimum complexity [1],[7]. The variation of firing angle \( \alpha \) from 90\(^{\circ}\) to 180\(^{\circ}\) produces increasing distortion of the current in the FC-TSR-TCR branch, and consequently that of line current. It increases the RMS value of the line current and the THD, and deteriorates the power factor.

The literature [1] to [20] does not deal with the implementation of FC-TSR-TCR system. An attempt is made in the present work to implement FC-TSR-TCR system using Atmel microcontroller.

Calculation of the firing angle can be made in the time domain [4] or in the frequency domain[5]-[6], using different approaches. Assuming the supply voltage to be sinusoidal, calculation of the firing angle is obtained with minimum complexity [1],[7]. The variation of firing angle $\alpha$ from $90^\circ$ to $180^\circ$ produces increasing distortion of the current in the FC-TSR-TCR branch, and consequently that of line current. It increases the RMS value of the line current and the THD, and deteriorates the power factor.

II. FC-TSR-TCR SYSTEM

The FC-TSR-TCR system is modified by introducing TCRs. The TSR system gives stepped variation of current and TCR gives smooth variation of current. Thus the range of control of reactive power can be increased by using TSR. The TSR system consists of three reactors and three IGBTs. Three different amplitudes of currents can be obtained by using three switches. The FC-TSR-TCR system is best suitable for
The fundamental reactor current $I_{RMS}$ can be expressed as follows:

$$I_{RMS} = \frac{I_m}{\sqrt{2}} \left( \pi - \alpha + \sin 2\alpha / 2 \right)^{1/2} \quad (1)$$

The average thyristor current is

$$I_T = \frac{I_m}{\pi} \left( 1 + \cos \alpha \right) \quad (2)$$

The current in the reactor can be expressed with $v(t) = V \cos \omega t$ as follows:

$$i_L(t) = \frac{1}{L} \int_0^\alpha v(t) dt = \frac{v}{\omega L} \left( \sin \omega t - \alpha \sin \frac{\omega t}{2} \right) \quad (3)$$

The fundamental reactor current $I_{L,f}(\alpha)$, can be expressed as a function of angle $\alpha$:

$$I_{L,f}(\alpha) = \frac{V}{\alpha L} \left( 1 - \frac{\alpha}{\pi} - \frac{\alpha^2}{\pi^2} \sin 2\alpha \right) \quad (4)$$

The amplitudes of these are a function of angle $\alpha$, as expressed by the following equation:

$$I_{L,n}(\alpha) = \frac{V}{\alpha L} \frac{4}{\pi} \left\{ \frac{\sin \alpha \cos(n\alpha) - n \cos \alpha \sin(n\alpha)}{n(n^2 - 1)} \right\} \quad (5)$$

Under steady-state conditions, when the thyristor valve is closed and the TSC branch is connected to a sinusoidal ac voltage source, $v = V \sin \omega t$, the current in the branch is given by

$$i(\omega t) = i \omega L \frac{\sin^2 \omega t}{\frac{n^2}{\pi^2} - 1}$$

Where

$$n = \frac{1}{\sqrt{\omega L C}} = \sqrt{X_c / \sqrt{X_L}} \quad (7)$$

III. SIMULATION RESULTS

The simulation circuit of FC-TSR-TCR system is shown in Fig.2. The scope-1 is used for indicating the switching pulses for the controlled reactors. The scope-2 represents the current through the load. Scope-3 indicates the voltage across the load. Scope-4 is used to indicate the real and reactive powers. Scope-5 represents the source current. The input current is shown in Fig 3a. The pulses given to the gates of $S_1$ and $S_2$ are shown in Fig 3b. The voltage across the tapped reactor is shown in Fig 3c. The pulses given to the IGBT’s across the reactors are shown in Fig 3d. Four different switching combinations are used as shown in Fig 3d. The load current is shown in Fig 3e. The voltage across the load is shown in Fig 3f. The active and reactive powers are shown in Fig 3g. Current through the reactor with $L = 10\text{mH}$ is shown in Fig 3h. Current with $L = 40\text{mH}$ is shown in Fig 3i. Current through the reactor with $L = 70\text{mH}$ is shown in Fig 3j. The variation of current with the inductance is given in the curve shown in Fig 3k. It can be seen that the TCR current decreases with the increase in the value of inductance $L$.

IV. EXPERIMENTAL RESULTS

The hardware is implemented using Atmel microcontroller. The hardware layout is shown in Fig 4a. The hardware consists of driver board and power circuit board. Driving pulses to the MOSFET are shown in Fig 4b. Current through the reactor with \( L = 70\text{mH} \) is shown in Fig 4c. Current with \( L = 40\text{mH} \) is shown in Fig 4d. Current through the reactor with \( L = 10\text{mH} \) is shown in Fig 4e. From the figures 3 and 4, it can be seen that the experimental results coincide with the simulation results.

V CONCLUSION

The variation of reactive power using tapped inductor FC-TSR-TCR is analyzed. The variation of reactive power with the variation in the firing angle is studied. The range of reactive power control can be increased by using the combination of thyristor controlled reactor and fixed capacitor system. The circuit model for FC-TSR-TCR is obtained and the same is used for simulation using Matlab Simulink. From the simulation studies, it is observed that reactive power variation is smoother by using FC-TSR-TCR system. The experimental results are almost similar to the simulation results.
